# European Infrastructures for Seismology

Luca Trani

DIR Seminar  
19 Oct 2012

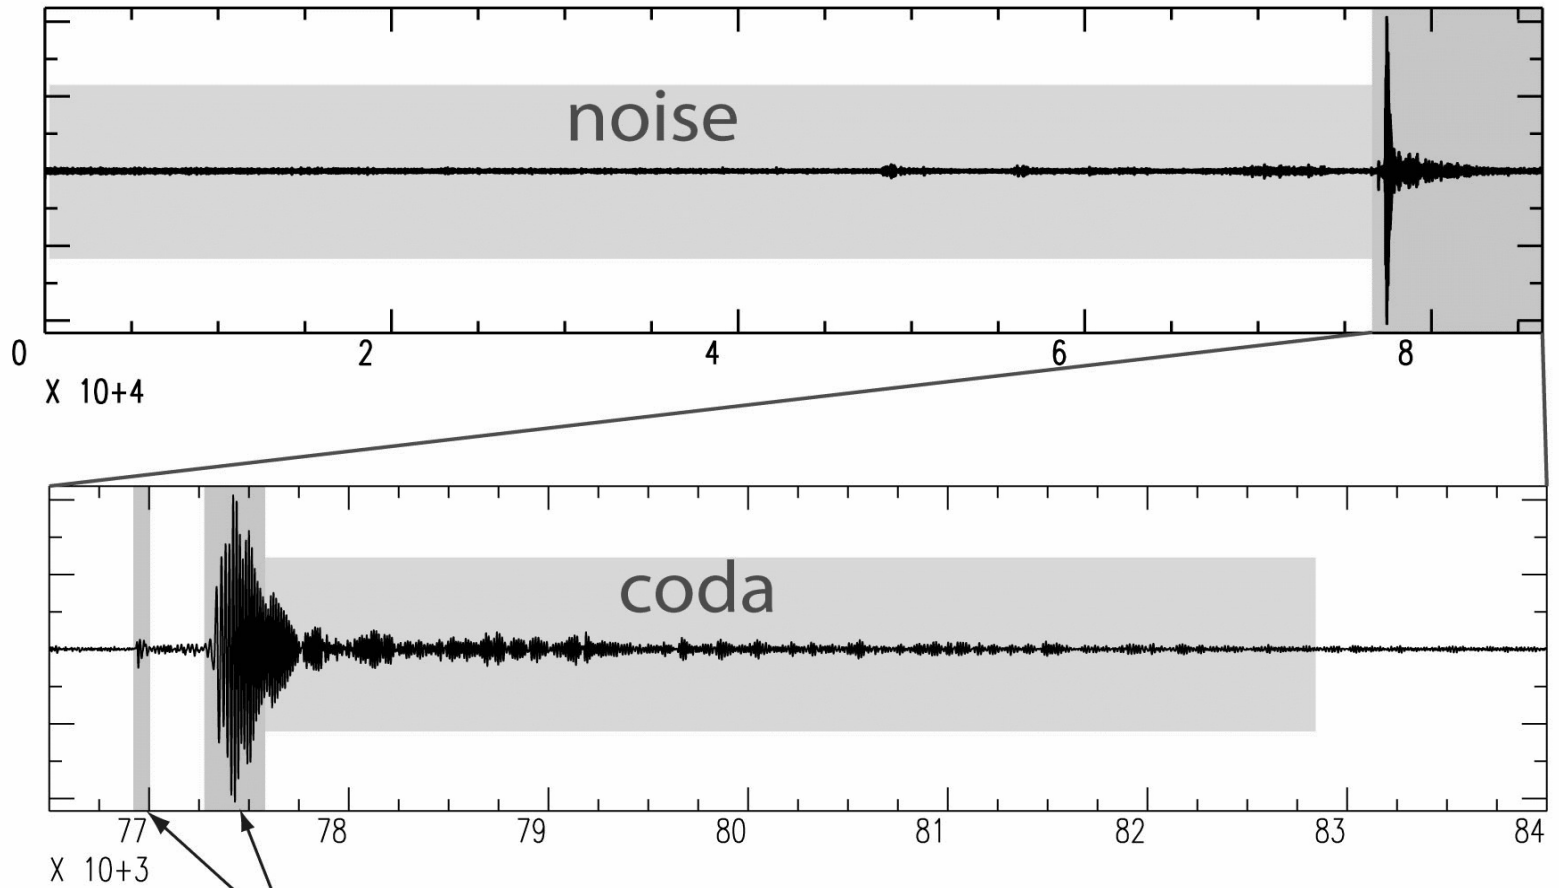

# A Wealth of Data

# Paradigm shift

one day of seismic record

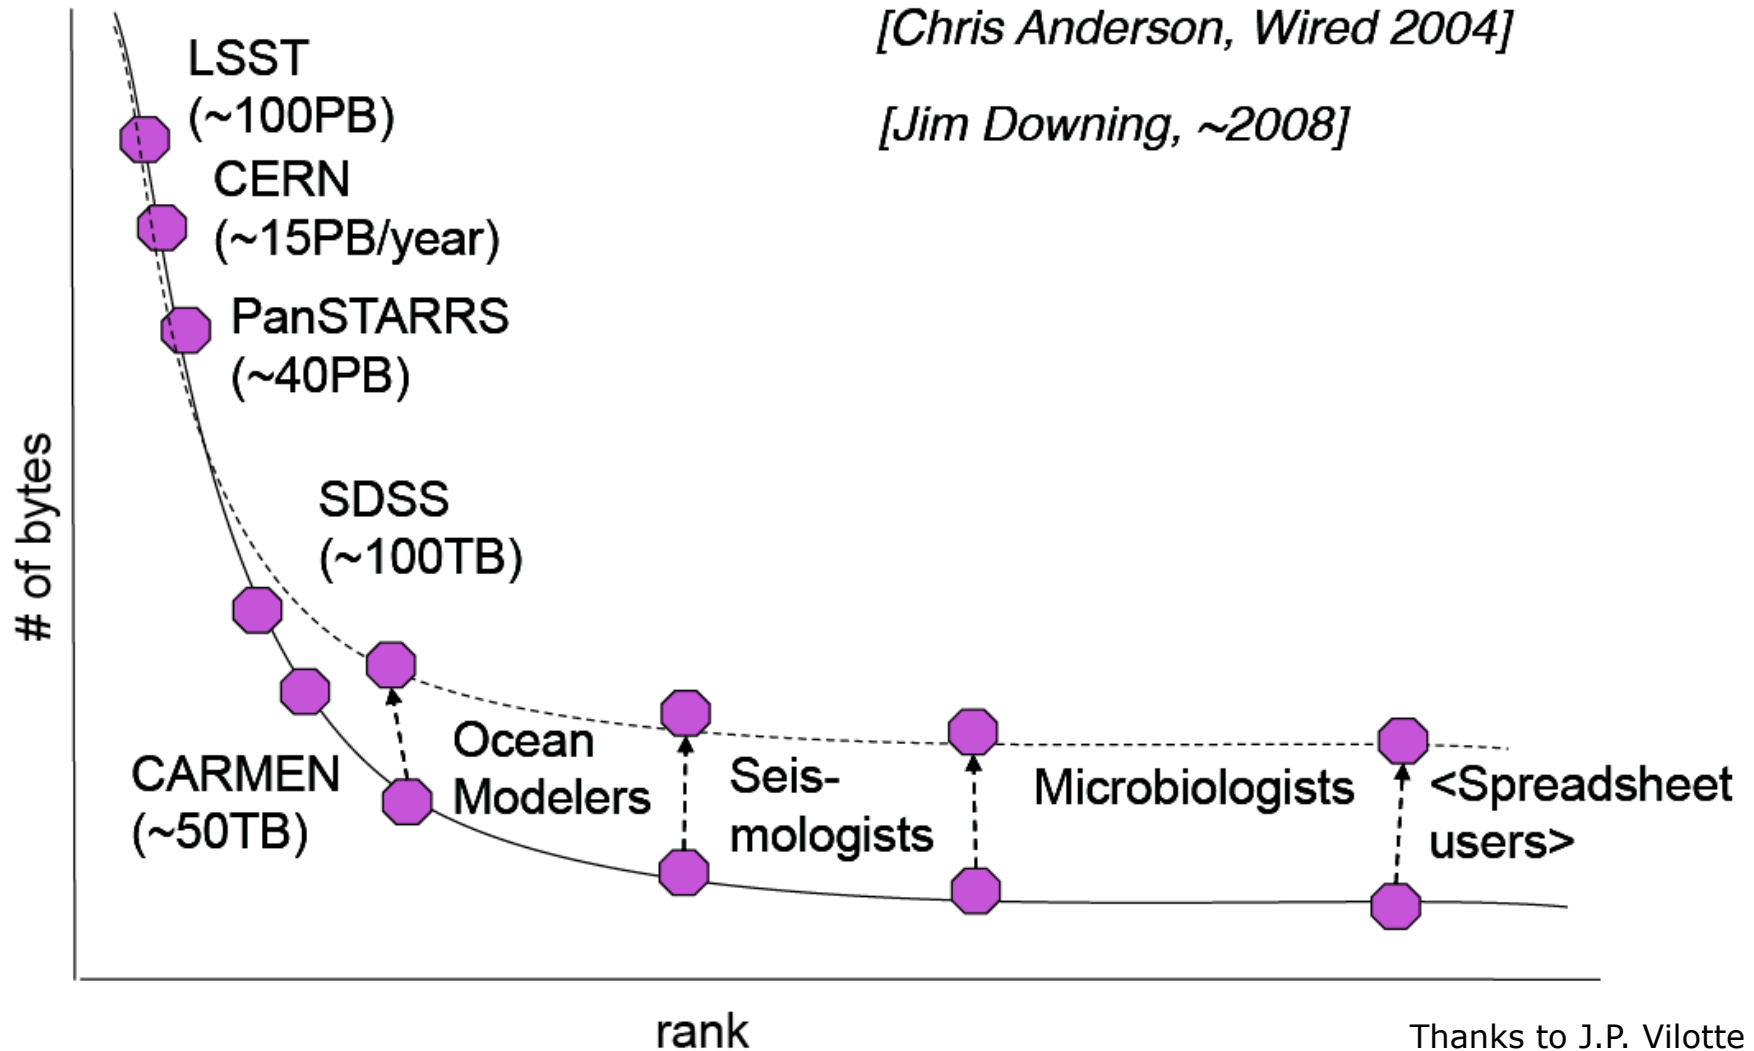

ballistic waves used in traditional tomography

# The long "Heavy" tail

[Chris Anderson, Wired 2004]

[Jim Downing, ~2008]

Thanks to J.P. Vilotte

# The need for e-infrastructures

Gigantic Earth Science Data Volumes require the development of new approaches to web-based data and model exchange, data mining and visualization (500 seismometers yield  $\approx 17$  GB/day and 6.2 TB/year)

**“Virtual Earth Laboratory”** - Hypothesis testing will make increasingly use of high-performance simulation technology of Earth’s dynamic behaviour

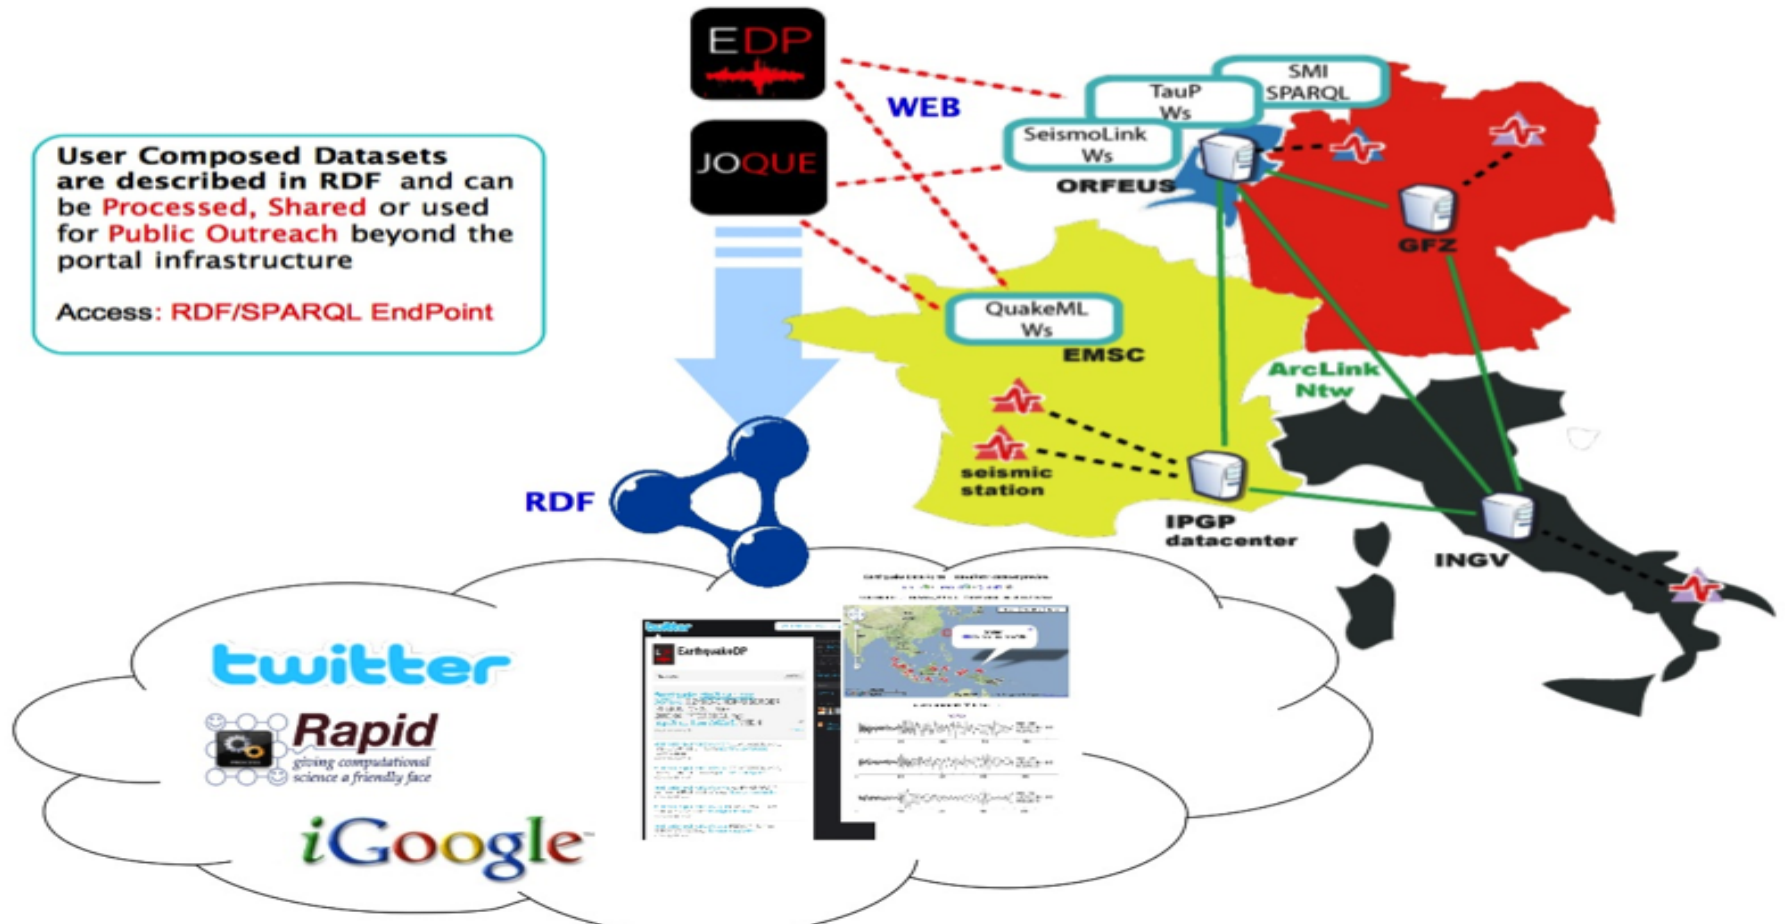

**“Software as Infrastructure”** – scientific simulation technology needs to be adapted and maintained for wide use by the community

**“Data rich”** Elements: Web-based superstructure linking Earth Science Data Centres, standardise multi-disciplinary data and model exchange

**“Cpu rich”** Elements: Simulation and processing technology needs to be professionally engineered, linked to the European High-Performance Computing infrastructure and the scientific data infrastructure

# Current infrastructure (thanks to NERIES)

# EUDAT Core Services

Community-oriented

Enabling Services

## EUDAT Portal

Integrated APIs and harmonized access to EUDAT facilities

## Metadata Catalog

Aggregated EUDAT metadata domain.  
Data inventory

Requirement  
Provide an inventory of metadata across disciplines

Function  
- Joint metadata domain  
- Catalog indexing stored data

eudat-metadata@postit.csc.fi

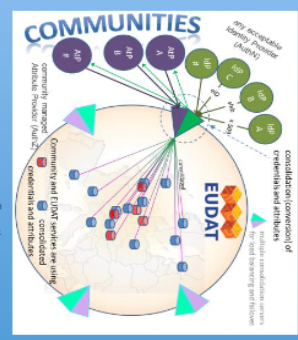

## AAI

Network of trust among authentication and authorization actors

Requirement  
Provide a working AAI system in a federated scenario

Function  
- Federate existing identification systems  
- Provide a network of trust among AAI IdP and SP providers, attribute authorities and federations attribute harmonization

eudat-AAI@postit.csc.fi

## Data Staging

Dynamic replication to HPC workspace for processing

Requirement  
Provide a service to stage data between EUDAT infrastructure and HPC/HTC resources

Function  
Dynamically replicate subset of data stored in EUDAT to HPC workspace

eudat-datastaging@postit.csc.fi

## Safe Replication

Data curation and access optimization

Requirement  
Provide a service to replicate and curate data to selected data center(s)

Function  
- Safe replication from one data center to another  
- Data curation and accessibility

eudat-safereplication@postit.csc.fi

## Simple Store

Researcher data store (simple upload, share and access)

Requirement  
Provide a simple service to store user data temporarily

Function  
Simple upload  
Store data

eudat-simplestore@postit.csc.fi

Building Blocks of the Collaborative Data Infrastructure

<http://www.eudat.eu/services-and-technologies>

# Safe Replication @ EUDAT

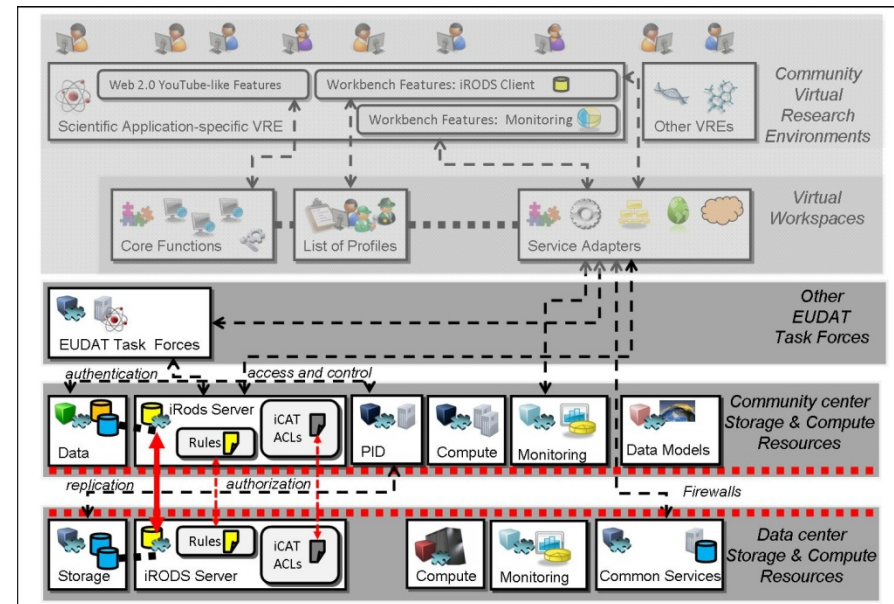

**Objective:** Enable communities to easily replicate data to selected data centres for storage in a robust and reliable manner.

**Key benefits:** data bit stream preservation, more optimal data curation, better accessibility

**Description:** Data replication management based on users' requirements and constraints; data replication solutions and services embedded into critical security policies, including firewall setups and user accounting procedures.

**Technology:** iRODS to be used as an initial replication middleware, implemented across the community centres and data centres; as more user communities join the task force, other storage technologies may be added, depending on user needs.

- Production setup expected by 2013, such that users will be able to safely replicate data across different user community centres and data centres.

Integrated Rule-Oriented Data System

**More info:** [eudat-safereplication@postit.csc.fi](mailto:eudat-safereplication@postit.csc.fi)

# PIDs@EUDAT

**Objective:** Deploy a robust, highly available and effective PID service that can be used within the communities and by EUDAT.

**Description:** Keeping track of the “names” of data sets or other digital artefacts deposited with the CDI requires more robust mechanisms than “noting down the filename”. The PID service will be required by many other CDI services, from Data Movement to Search and Query.

**Technologies:** Currently considering use of both EPIC for data objects, and DataCite to register DOIs (Digital Object Identifiers) for published collections.

**More info:** [eudat-persistentidentifiers@postit.csc.fi](mailto:eudat-persistentidentifiers@postit.csc.fi)

# Data Staging @ EUDAT

**Objective:** Enable communities to perform (HPC) computations on the replicated data

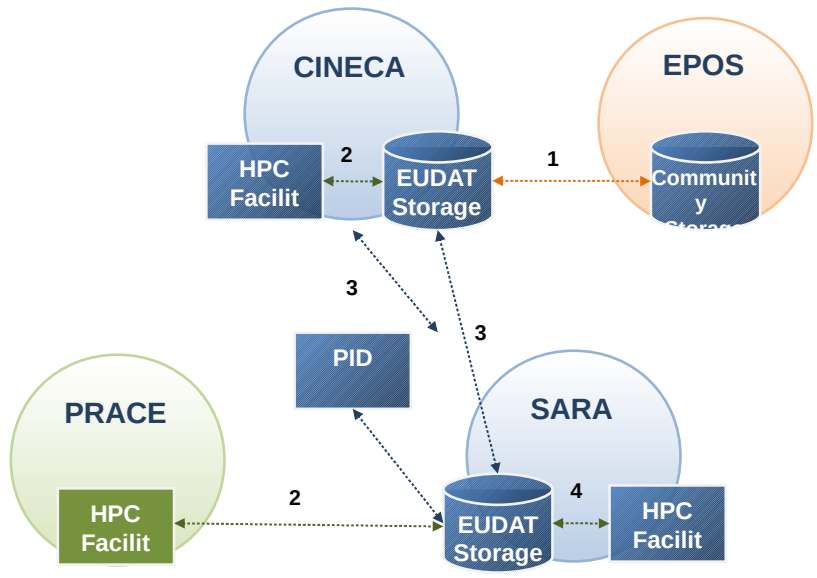

**Key benefits:** Access to large computing facilities

**Description:** This service will allow the EUDAT communities to dynamically replicate subsets of their data stored in EUDAT to HPC machine workspaces for processing.

Differences with the safe replication scenario:

- replicated data are discarded when the analysis application ends;
- Persistent Identifier (PID) references are not applied to replicated data into HPC workspaces;
- Users initiate the process of replicating data while in the safe replication scenario data are replicated automatically on a policy basis.

**Technologies:** GridFTP, Griffin, gTransfer, FTS (under appraisal)

**More info:** [eudat-datastaging@postit.csc.fi](mailto:eudat-datastaging@postit.csc.fi)

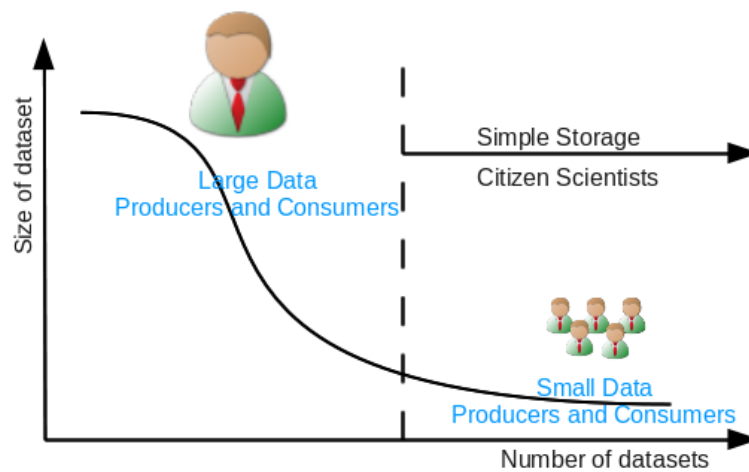

**Objective:** create an easy-to-use service that will enable researchers and scientists to upload, store and share data that are not part of the officially-managed data sets of the research communities.

**Key benefits:** Store, share, and retrieve smaller sets of data not officially handled.

**Description:** This service will address the long tail of "small" data, and the researchers/citizen scientists creating and manipulating it. Typically this type of data comes in a wide range of formats including text, spreadsheets, number series, audio and video files, photographs and other images. The Research Data Store is complementary to the other EUDAT services that manage the large volumes of official community data.

**Technologies:** Invenio, figshare, beehub and MyExperiment.

**More info:** [eudat-simplestore@postit.csc.fi](mailto:eudat-simplestore@postit.csc.fi)

**Objective:** Create a joint metadata domain for all data stored by EUDAT data centres and a catalogue which exposes the data stored within EUDAT, allowing data searches.

**Key benefits:** Advertising platform for data sets, metadata service for less mature communities

**Description:** EUDAT will handle metadata for more resources than just those deposited within the EUDAT CDI. In the initial phase we will target mainly resources contributed by the participating communities augmented with those of interested well-organized communities that are ready to contribute. Then, later, other interested communities can be approached depending on the respective community capabilities.

**Technology:** OAI-PMH and embeds domain specific metadata, as XML, within the OAI-PMH record

**More info:** [eudat-metadata@postit.csc.fi](mailto:eudat-metadata@postit.csc.fi)

# AAI@EUDAT

**Objective:** Provide a solution for a working AAI system in a federated scenario.

**Description:** Design the AA infrastructure to be used during the EUDAT project and beyond.

**Key tasks:**

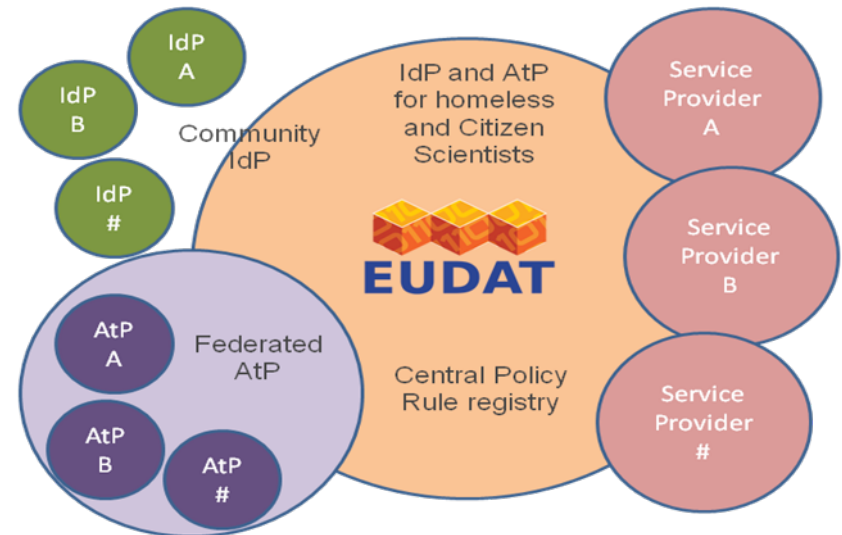

Leveraging existing identification systems within communities and/or data centres

Establishing a network of trust among the AA actors:  
Identify Providers (IdPs), Service Providers (SPs), Attribute Authorities and Federations

Attribute harmonization

**Technologies:** Oauth2, OpenID, RADIUS, SAML2, X.509, XACML, etc.

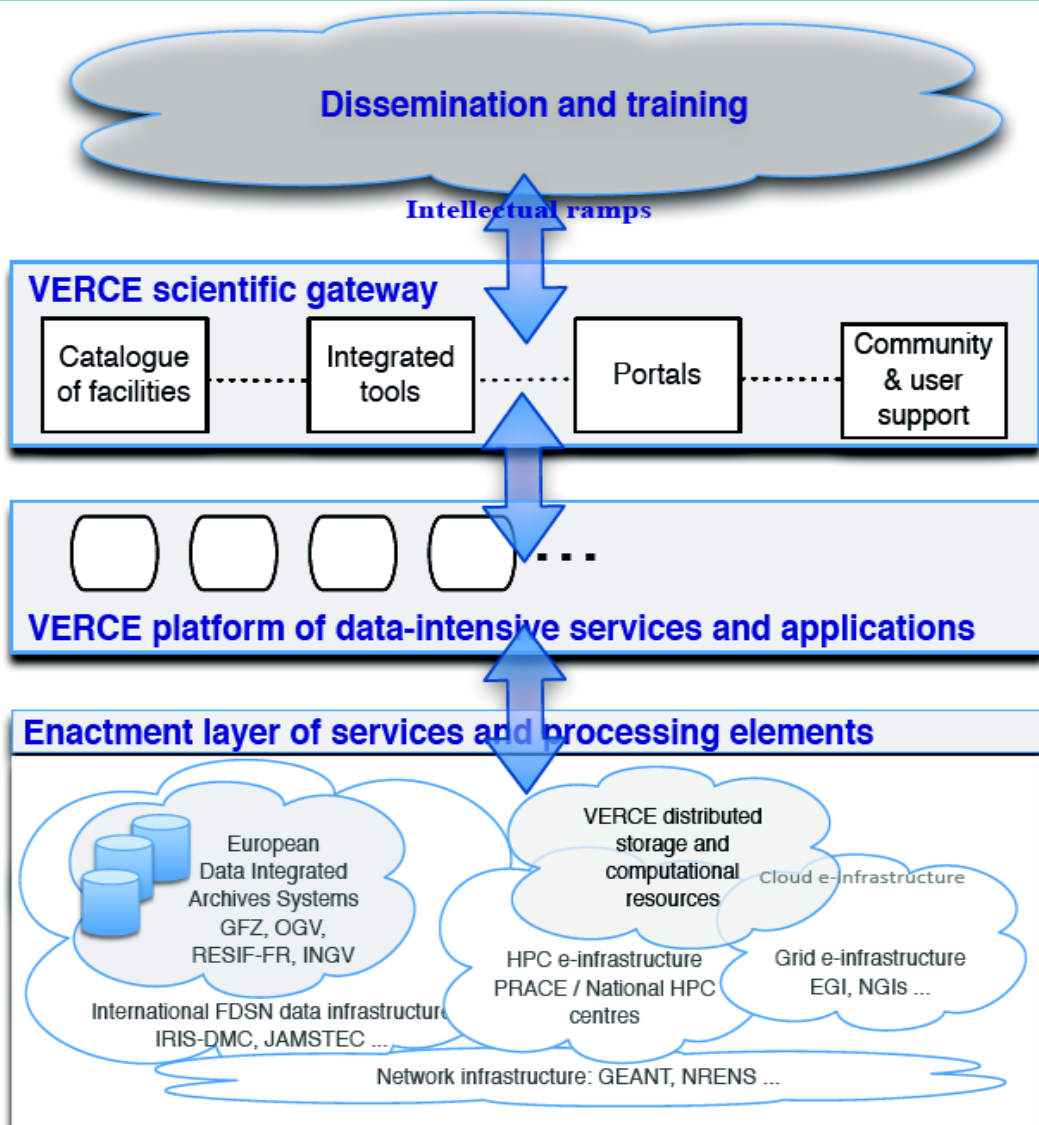

**More info:** [eudat-AAI@postit.csc.fi](mailto:eudat-AAI@postit.csc.fi)

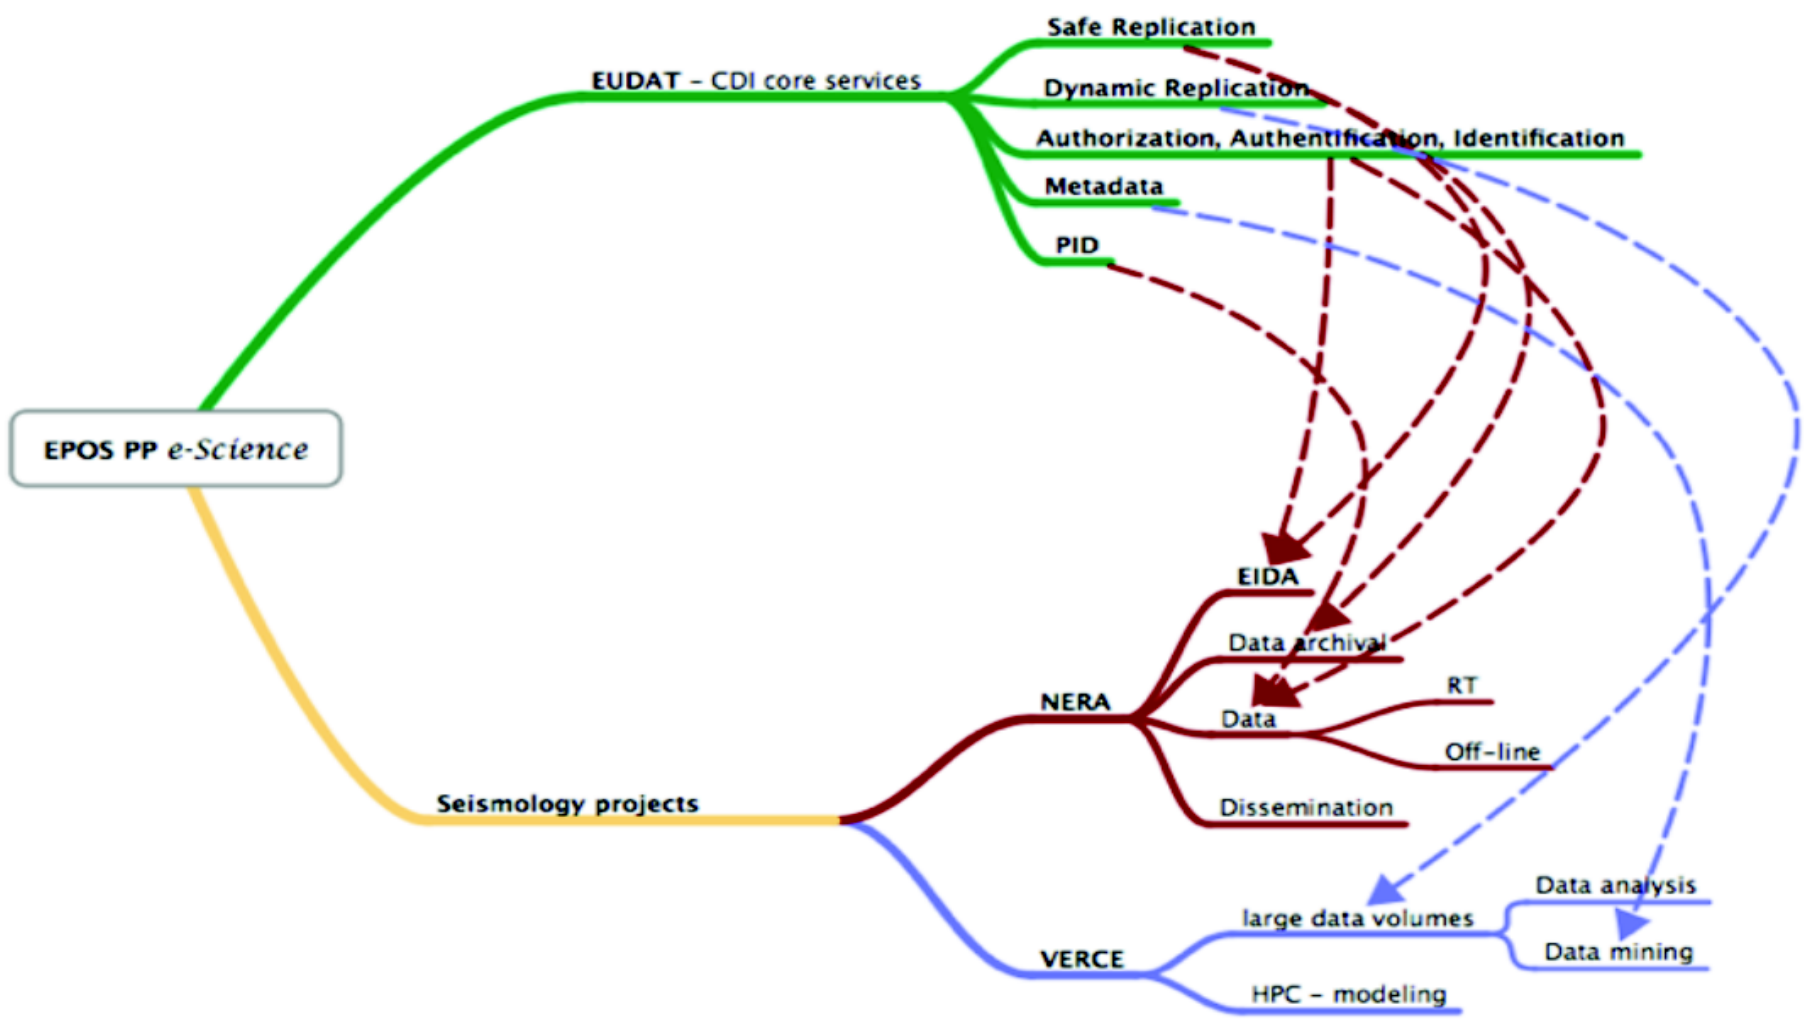

# The VERCE platform

- Technology Stack**
- Web Portal:** Jetspeed, Rapid
- Workflow Enactment:** ADMIRE
- Service & Interoperability:** OGSA-DAI, SAGA, DRMAA
- Coupling & Execution:** Kepler, MUSCLE, GridSpace
- Data Infra:** Arclink, NetCD, iRODS
- Grid & HPC Infra:** gLite, UMD, UNICORE, OMII-Europe
- Federated AAI, single sign-on:** Shibboleth, SAML, SLCS, VOMS

# Importance of Metadata

The metadata must be fit for purpose for the following functions related to a digital object:

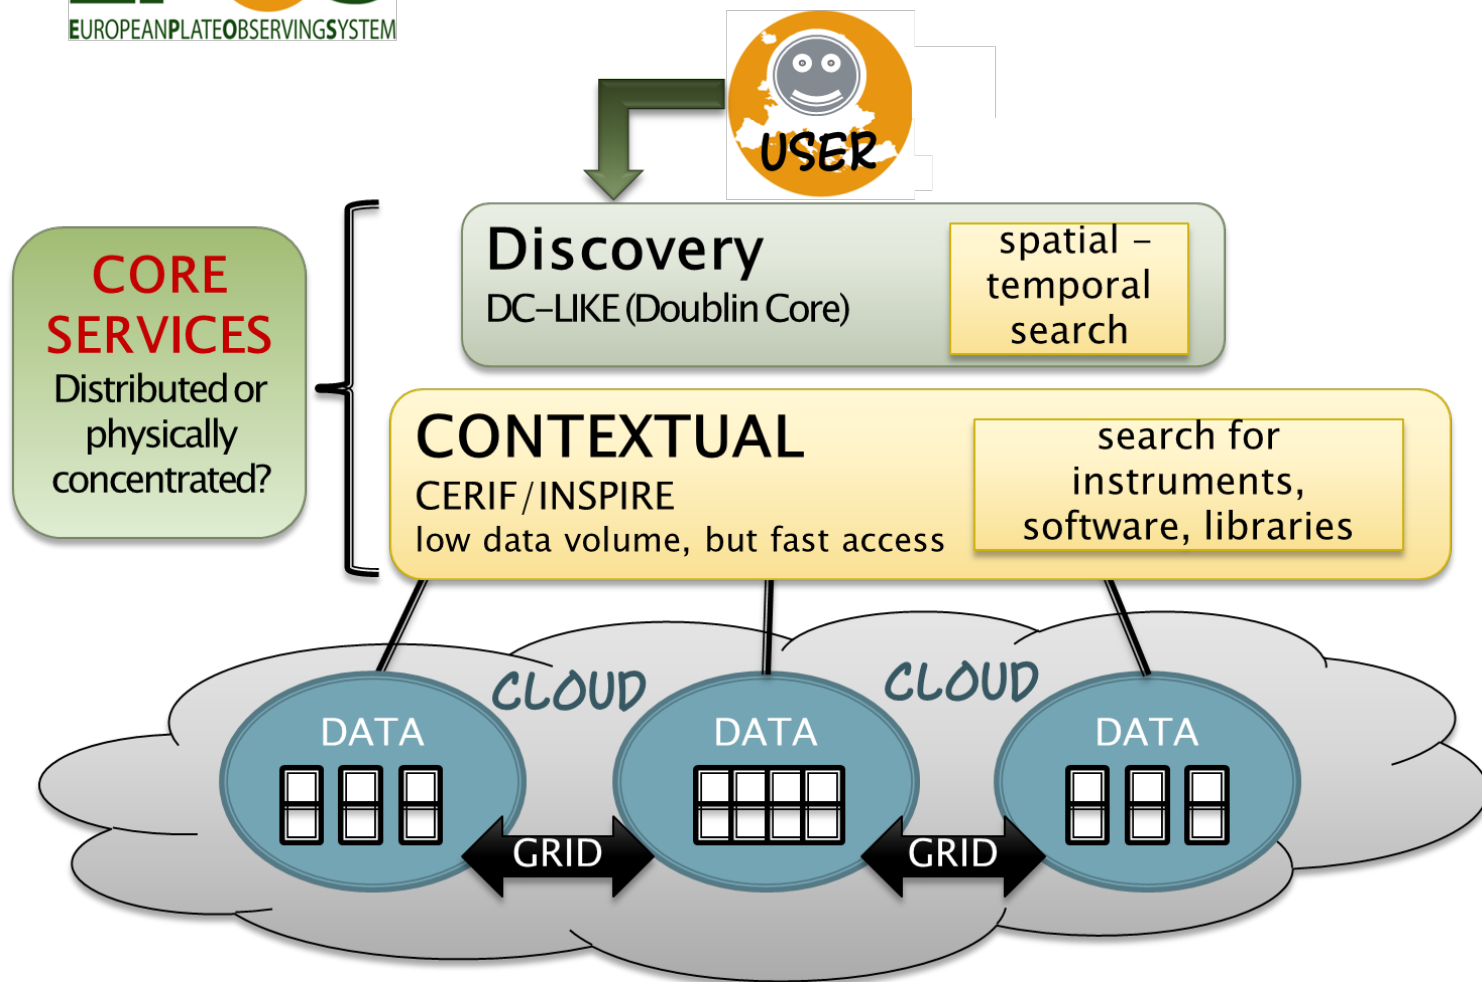

- discovery,
- reading,
- ingesting,
- combining,
- processing,
- outputting as a modified version,
- citing,
- preserving, (all related to organisations, projects, persons, other datasets, publications etc and located in space and time).

# Metadata a first design

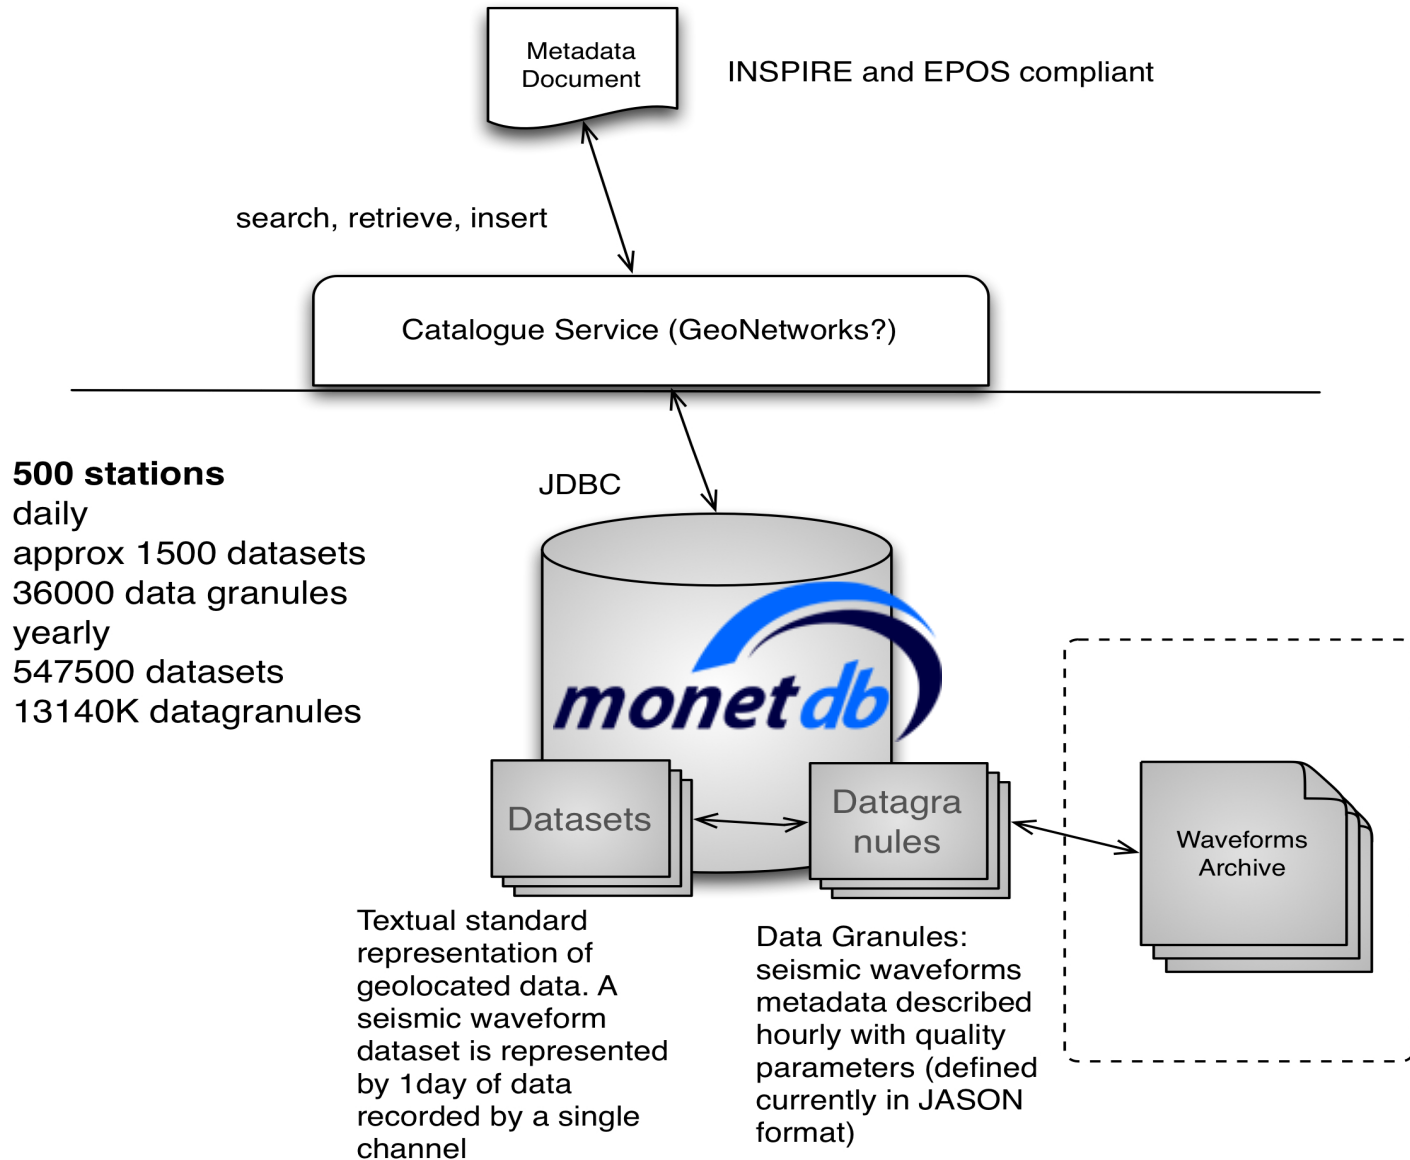

## STRAWMAN ARCHITECTURE

# Data Management @ ORFEUS

# NERA

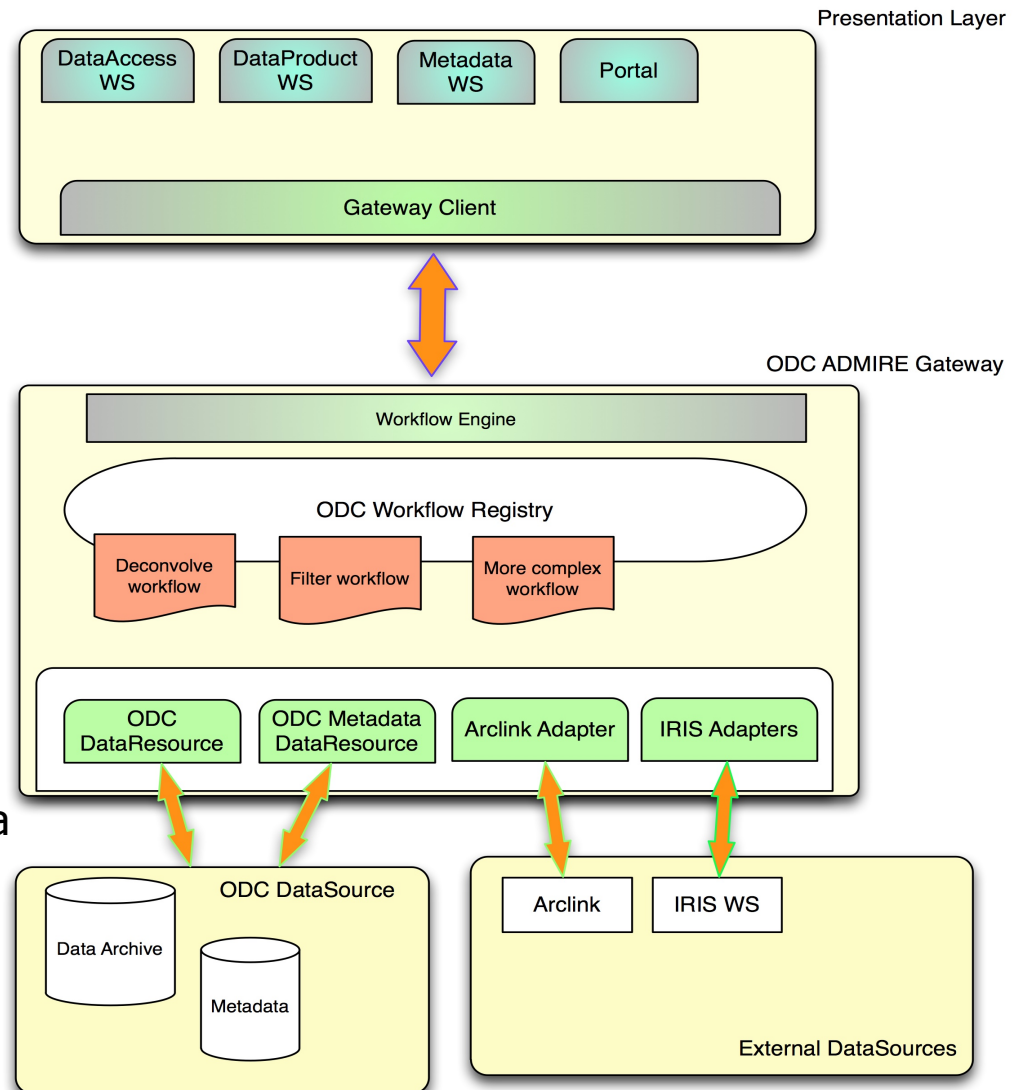

# Data Products @ ORFEUS

Extensible WS Interface for the user services and presentation layer

Data products obtained by workflows execution

Homogeneous extensible collection of adapters(OGSA-DAI activities) for data access

**NERA**, **VERCE** and **EUDAT** are all EC projects that can provide some major contribution to **EPOS** for the seismological part.

- NERA - should provide some basic services, software and tools eventually integrated in a seismological portal
- VERCE - should provide tools and computational power otherwise not available and, in general, a testbed for implementing and developing HTC and HPC applications.
- EUDAT - should provide expertise and core services for federating and exploiting data located across geographically distributed archives , the availability of user/ groups workspaces and interaction among different users and digital object preservation, curation and access
